DIAGNOSTIC

INFECTIONS PÉRI-PROTHÉTIQUES

Musculo Skeletal Infection Society 2018 (*Parvizi, JOA, 2018*)

Major criteria (at least one of the following)	Decision
Two positive cultures of the same organism	Infected
Sinus tract with evidence of communication to the joint or visualization of the prosthesis	

Preoperative Diagnosis	Minor criteria		Score	Decision
	Serum	Elevated CRP <i>or</i> D-Dimer	2	
Elevated ESR		1		
Synovial	Elevated synovial WBC count <i>or</i> LE	3		
	Positive alpha-defensin	3		
	Elevated synovial PMN (%)	2		
	Elevated synovial CRP	1		

Intraoperative Diagnosis	Inconclusive pre-op score <i>or</i> dry tap		Score	Decision
	Preoperative score	-	-	
Positive histology	3	3		
Positive purulence	3	3		
Single positive culture	2	2		

DIAGNOSTIC

BIOMARQUEURS SYNOVIAUX: ALPHA-DÉFENSINE

- Test Synovasure: Sn 54 à 84% selon les classifications, Sp > 95% élevée ==> test de confirmation, pas de détection

Renz, JBJS, 2018

- VPP 100%, VPN 95% (critères MSIS)
- Précision similaire test Synovasure // ELISA

Gehrke, JBJS, 2018

DIAGNOSTIC

BIOMARQUEURS SYNOVIAUX: ALPHA-DÉFENSINE

- Indication idéale: situations microbiologiques complexes
 - IPP décapitée, discordance des résultats
- Limites du test :
 - Faux positifs: métallose, ALTR, chirurgie < 2 mois
 - Faux négatifs: germes à croissance lente
 - intérêt couplage avec la CRP synoviale

POSTER #422

RAPID DIAGNOSTIC TEST OF PERSISTENT INFECTION IN PROSTHETIC TWO-STAGE EXCHANGE

Introduction: Two-stage exchange remains the gold standard for treatment of periprosthetic joint infection (PJI). Following the second stage, a broad spectrum probabilistic antibiotherapy is usually administered until sample cultures return negative. **Rapid diagnosis of persistent infection would be useful to limit unnecessary antibiotic exposure**

OBJECTIVE: TO INVESTIGATE THE PERFORMANCE OF THE ALPHA-DEFENSINE LATERAL FLOW DEVICE TO DETECT PERSISTENT INFECTION AT THE TIME OF JOINT RECONSTRUCTION IN A TWO-STAGE EXCHANGE PROCEDURE

Methods:

- Prospective monocentric study. From June 2016 to July 2018
- Inclusion criterion: two-stage procedure for PJI
- The first stage consisted in implant removal, aggressive debridement and insertion of an antibiotic-loaded cement spacer. Adapted antibiotherapy was then administered during 6 weeks, followed by an antibiotic free period of at least 3 weeks. If inflammation blood markers tested negative, the second stage was completed, which involved removal of the spacer, repeated debridement and joint reconstruction. The alpha defensine detection test was carried out extemporaneously on the synovial fluid in contact with the cement spacer (Fig.1), simultaneously to microbiological sampling.
- Results were compared with the Musculoskeletal Infection Society (MSIS) criteria for PJI.

Figure 1: Schematic representation of the procedure in four steps: A: Draw synovial fluid into pipette; B: Mix with buffer solution; C: Deposit onto device; D: Read results in 10 minutes

[Photographs: Zimmer Biomet]

Results: 24 patients with a mean age of 65 years (20-81 years) were included (Table 1). Microbiological cultures were negative in all cases but one fungal co-infection. Therefore, the negative predictive value (NPV) of the test was 96%

Table 1: Patients characteristics and findings in two-stage exchange

Patient	First Stage			Second Stage					
	Joint Involved	Age (yr)	Gender	Bacteria	CRP (mg/L)	Leucocytes (G/L)	Positive sample / Total number of samples	Bacteria	Alpha Defensin Test
1	Shoulder	65	M	S. saprophyticus	219	20	0/4	-	Negative
2	Hip	80	M	E. coli	0.5	6.7	1/5	S. capitis	Negative
3	Knee	71	M	E. faecalis	24	10	0/5	-	Negative
4	Hip	65	M	S. haemolyticus	6	6.2	0/5	-	Negative
5	Knee	67	M	E. faecium E. faecium E. faecium	16	8.2	2/5	S. epidermidis E. faecium	Negative
6	Knee	66	F	S. agalactiae	2.5	10.5	0/5	-	Negative
7	Knee	73	F	S. epidermidis	5.2	10.3	0/5	-	Negative
8	Knee	79	F	S. warneri	8	7.5	0/5	-	Negative
9	Ankle	73	F	S. saprophyticus	3	6.2	0/5	-	Negative
10	Knee	71	F	S. simulans	24	9.4	0/5	-	Negative
11	Knee	70	M	S. aureus	8	10.4	0/5	-	Negative
12	Knee	56	F	S. epidermidis	1	8.2	0/5	-	Negative
13	Knee	70	M	E. coli	3.4	7.7	0/5	-	Negative
14	Hip	43	M	S. aureus	16	10.3	0/5	-	Negative
15	Hip	81	F	S. dysgalactiae	8	9.2	0/5	-	Negative
16	Ankle	49	F	S. warneri	1.2	7.6	0/5	-	Negative
17	Knee	71	F	Granulococcus adhaerens	2.2	6.3	0/5	-	Negative
18	Knee	63	F	S. aureus E. faecalis	18	9.9	0/5	-	Negative
19	Hip	20	M	P. aeruginosa S. epidermidis Corynebacterium	2.8	6.4	0/5	-	Negative
20	Hip	61	M	Streptococcus	5	8.5	0/5	-	Negative
21	Hip	62	F	S. aureus	1	8.4	0/5	-	Negative
22	Hip	69	F	S. capitis	8	7.8	1/5	Green Negative	Negative
23	Hip	72	M	S. aureus	12	9.3	0/5	-	Negative
24	Knee	62	M	S. aureus	5	8.1	0/5	-	Negative

CONCLUSION: WITH A HIGH NPV, THE ALPHA-DEFENSIN TEST APPEARS TO BE A RELIABLE TOOL TO RULE OUT PERSISTENT INFECTION AT THE SECOND STAGE OF A PJI TREATMENT. THE TEST SHOULD BE CONSIDERED AND FURTHER EVALUATED TO LIMIT UNNECESSARY ANTIBIOTIC EXPOSURE

CHANGEMENT PRECOCE EN UN TEMPS

American Association of Hip and Knee Surgeons
ANNUAL MEETING

Early one-stage revision is indicated for infected cementless THA

Orthopaedics Today Europe, November 2019

+ ADD TOPIC TO EMAIL ALERTS

Fares S. Haddad

DALLAS — Simple lavage and irrigation and debridement are inappropriate for managing a patient whose cementless total hip arthroplasty is acutely infected. This situation calls for a rapid return to the OR for one-stage revision surgery and aggressive debridement and treatment of the infection, according to a presenter at the American Association of Hip and Knee Surgeons Annual Meeting.
